

We create a new standard,  
we give a new shape to light

Return to proven solutions.

The best features of a traditional bulb and LED light source have been combined by us into one. This is how Kanlux XLED originated - a real "LED bulb". When you pick it up, you can see a perfectly known model - with a glass bulb, traditional thread and "filaments".

You can choose from as many as 48 different models and after turning on any of them, you are surrounded by a wide circle of light with exactly such power as you need - corresponding even with traditional 150 W bulbs.

This light has unusual power!

If you look carefully at Kanlux XLED, you will notice that the "filaments" are durable LED filaments, thanks to which you will have **even up to 15,000 hours of work** and which consume very little electric energy. In addition, you will discover Kanlux XLED, thanks to which from the same "LED bulb" **you can obtain any colour of light:** warm, neutral or cold.

In particular models of the bulbs **you can also darken light.** Three degrees of brightness will allow you to set different light when you read a book for a child before falling asleep and different one - when you leave the lamp turned on for him or her.

### Rediscover the might of a glass bulb

When 140 years ago a bulb occurred, people gained access to a friendly and safe source of light. In the 21st century, bulbs with filaments gave way to ecological and energy-saving LED lighting.

Today, the history has come full circle. We combined all assets of a traditional bulb and LED light source into one - into the real "LED bulb".

### Discover the light of Kanlux XLED

The real "LED" bulb will surround you and your friends and family with friendly and safe light. You can freely choose the colour temperature of lighting: from warm, through neutral, to cold.

Kanlux XLED is a "LED bulb" with a glass bulb in the shape, with dimensions and threads identical to the old one. Width of the light angle in it is exactly such as in bulbs with filaments: **as many as 320 degrees!**

# Ideal combination of LED and a traditional bulb

The first bulb of this type in Kanlux offer.

## A wide angle of light spread

A glass bulb reaching the thread allows light to part in all directions. Thanks to this, the angle of light comes to even 320 degrees! We have taken such a solution directly from ordinary bulbs and we are sure that you will love this effect in "LED bulbs" too.

## A traditional shape and dimensions

A glass bulb, E27 or E14 thread - this is exactly what we have in mind when we talk about a bulb. For over a dozen years, all of us have missed it! Kanlux XLED as the real "LED bulb" comes back to old, classic dimensions of the light source.

## A glass bulb

The „LED bulbs“ are closed in bulbs of pure glass, with no plastic elements. The transparent or milky bulbs contain LED filaments, similar to traditional filaments.

## Width of the offer

Most of us prefer warm light, however, for some purposes you need light in a neutral or cold colour.

Thanks to the "LED bulbs" you can choose such a temperature which suits you best.

Our offer includes even such a model of a bulb in which you can freely change the colour temperature.

## Energy efficiency

Kanlux XLED means impressive energy efficiency and up to 15,000 hours of lighting. You will notice the difference quickly in monthly expenditures on electric energy.

## Free power of light

We re-establish the former power of light! The Kanlux XLED collection offers equivalents to all traditional bulbs - from 25 W to 100 W. Selection of an appropriate light source has become simple again.
